EDUCATION

Illinois Institute of Technology - Chicago, IL — Graduated in August 2014
Master's degree in Computer Science — GPA: 3.40/4.0

ESME Sudria - Paris, France — Graduated in September 2016
Master's degree in General Engineering — GPA: 14.17/20

SKILLS

Programming Languages: Golang, Python, C, C++, JavaScript, Lua
Cloud Platforms: AWS, GCP, and multi-cloud application development
Performance & Optimization: Monitoring, Tracing, Application profiling (pprof, Datadog), CDN configuration
Distributed Systems: Real-time data processing, high-throughput systems (up to 500K+ events/sec), feature flags (LaunchDarkly), microservices architecture
Languages: English (advanced), French (native)

EMPLOYMENT

FuboTV – Lead Senior Software Engineer 09/2019 – 11/2023

- Created and scaled our ad infrastructure to support the growing number of users watching our streams (from less than 100K to almost 1,500K)
- Created the first monitoring dashboards (Datadog graphs on first and third party metrics) that helped us understand how our main application was performing in real time which led the advertising engineering team proposing a company wide advertising partner change in order to monetize more efficiently
- Supervised and contributed to the development and integration of server-side and client-side ad insertion technologies across new partners (Disney, NBC, Roku)

FuboTV - Software Engineer 08/2018 – 09/2019

- Implemented the delivery of ad-enabled stream urls for all device platforms (iOS, appleTV, android…) and playback types (liveTV, startover, vod, …)
- Automated the creations, updates of our main CDN configurations and AWS MediaTailor endpoints which found itself to be really helpful when FuboTV got hacked in 2022 during the semi finals of the world cup
- Created new GCP infrastructure (kubernetes clusters, node pools and configuration of pod affinity / anti-affinity) to separate computational resources across advertising services
- Created the first server-side header bidding integration which was the interface we used for all our server side advertising integrations

SimpleReach – Software Engineer 08/2017 – 08/2018

- Implemented, deployed and maintained a data-intensive application which drastically changed the way we processed all web events at SimpleReach. This app was processing terabytes of data every day and approximately 50K events per second. I wrote a blog post about one of the issues we encountered in the first stage of deploying this application: https://medium.com/@thomas.theissier/c2c62c8e23bf
- Maintained and added features to the core components of the SimpleReach infrastructure

MediaMath – Backend Software Engineer (Media Squad) 01/2016 – 08/2017

- Moved the supply related entities out of the main API/database into our own service. For that initiative, I wrote a Kafka consumer that stores the entities we need to validate against and a Kafka producer for internal teams that have to consume the changes happening to our entities
- Worked on the implementation of a few features for our real-time bidding engine, a C++ application that handles between 2 to 3 millions requests per second
- Designed an application that served as a model for other APIs implemented inside our team. We deployed multi-container Docker environments (nginx, flask, gunicorn stack) to AWS Elastic Beanstalk
- Implemented an API that directly talks to Akamai nodes in order to serve custom on-site responses

MediaMath – Integrations Engineer (Platform Integrations) 11/2014 – 01/2016

- Develop scripts, DB routines on an as-needed basis to automate integrations with clients and partners (won the 2016 winter MediaMath hackathon on a team of 3)
- Develop, deploy and maintain custom web based tools (Lua scripts, Python processes, API, Angular apps) to respond to unique client needs on the MediaMath TerminalOne platform
